

How to implement iSCSI multipath on Linux OS

JetStor X Series White Paper

January 2021

NOTICES

This white paper is applicable to the following JetStor SAN models: JetStor X
Storage System 4U 19" Rack Mount Models

MODEL NAME	CONTROLLER TYPE	FORM FACTOR, BAY COUNT, AND RACK UNIT
824iXD/FXD	Dual Controller	LFF 24-disk 4U Chassis
824iX/FX	Single Controller	LFF 24-disk 4U Chassis

JetStor X Storage System 3U 19" Rack Mount Models

MODEL NAME	CONTROLLER TYPE	FORM FACTOR, BAY COUNT, AND RACK UNIT
816iXD/FXD	Dual Controller	LFF 16-dis 3U Chassis
816iX/FX	Single Controller	LFF 16-disk 3U Chassis

JetStor X Storage System 2U 19" Rack Mount Models

MODEL NAME	CONTROLLER TYPE	FORM FACTOR, BAY COUNT, AND RACK UNIT
812iXD/FXD	Dual Controller	LFF 12-DISK 2U CHASSIS
812iX/FX	Single Controller	LFF 12-disk 2U Chassis
826iXD/FXD	Dual Controller	SFF 26-disk 2U Chassis

Information contained in document has been reviewed for accuracy. But it could include typographical errors or technical inaccuracies. Changes are made to the document periodically. These changes will be incorporated in new editions of the publication. AC&NC may make improvements or changes in the products. All features, functionality, and product specifications are subject to change without prior notice or obligation. All statements, information, and recommendations in this document do not constitute a warranty of any kind, express or implied.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

PREFACE

Information, Tip and Caution

This manual uses the following symbols to draw attention to important safety and operational information.

INFORMATION:

INFORMATION provides useful knowledge, definition, or terminology for reference.

TIP:

TIP provides helpful suggestions for performing tasks more effectively.

CAUTION:

CAUTION indicates that failure to take a specified action could result in damage to the system.

AUDIENCE

In this document, it describes how to connect an iSCSI target in Linux OS via software iSCSI initiator and use the device-mapper-multipath package to create a multipath device which is presented by JetStor 824iX via iSCSI. All JetStor iSCSI dual controller models can be used within this configuration.

Environment

Host OS	Red Hat Enterprise Linux
Storage	824iX
Firmware	V1.4.4
RAM	8GB
iSCSI data port	10.10.10.100; 192.168.195.22
RPM packages	iscsi-initiator-utils- 6.2.0.873-10.el6.x86_64 device-mapper-1.02.79- 8.el6.x86_64 device-mapper-multipath- 0.4.9-72.el6.x86_64

Diagram

INSTALLATION

Before configuring the iSCSI multipath, you have to install the following rpm packages and source files (.tar.gz), so that the iSCSI service could run smoothly and without any compatible issues.

Here is the order to install the packages we need:

- iscsi-initiator-utils-6.2.0.873-10.el6.x86_64.rpm
- device-mapper-1.02.79-8.el6.x86_64.rpm
- device-mapper-multipath-0.4.9-72.el6.x86_64.rpm

All the necessary rpm packages can be found in the Linux OS DVD, install them as follows:

```
# rpm -ivh /media/"RHEL x86_64 Disc 1"/Packages/iscsi-initiator-utils-6.2.0.873-10.el6.x86_64.rpm
# rpm -ivh /media/"RHEL x86_64 Disc 1"/Packages/device-mapper-1.02.79-8.el6.x86_64.rpm
# rpm -ivh /media/"RHEL x86_64 Disc 1"/Packages/device-mapper-multipath-0.4.9-72.el6.x86_64.rpm
```

CONFIGURATION

Environment

The iSCSI initiator name can be specified in the configuration file `/etc/iscsi/initiatorname.iscsi`.

```
# vi /etc/iscsi/initiatorname.iscsi  
InitiatorName = Your_initiator_name
```

Edit the configuration file of iSCSI initiator in `/etc/iscsi/iscsid.conf`, the iscsi session timeout value has to be changed to a proper value. The default value is 120 seconds, but it is too long to keep the I/O wait before the path is judged as fail and it may cause the I/O failure. Please set a shorter and proper timeout value in this configuration file.

```
# vi /etc/iscsi/iscsid.conf  
node.session.timeo.replacement_timeout = 30  
(Please set a proper timeout value)
```

In `/etc/iscsi/iscsid.conf`, it also provides others settings, such as below showing:

```
# vi /etc/iscsi/iscsid.conf  
node.startup = Automatic  
(Set auto-login when discover target)  
node.session.auth.authmethod = CHAP  
(Enable CHAP auth)  
node.session.auth.username = username  
(Set CHAP username)  
node.session.auth.password = password  
(Set CHAP password)
```

Please restart the iSCSI service to make these changes work.

```
# service iscsi restart
```

Login the iSCSI target

The rpm package iscsi-initiator-utils provides a command line tool called iscsiadm. It can manage the connections to iSCSI target. The iscsiadm tool has three operational modes - discovery, node, and session. The following will introduce these modes.

1. Discovery the all port and target name by # iscsiadm -m discovery.

Operational mode -discovery is used to discover the target, the usage is

iscsiadm -m discovery -t st -p target_ip

```
# iscsiadm -m discovery -t st -p 10.10.10.100
192.168.1.1:3260,0 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr1
192.168.2.1:3260,0 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr1
10.10.10.100:3260,1 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr1
192.168.4.1:3260,1 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr1

# iscsiadm -m discovery -t st -p 192.168.195.22
192.168.5.1:3260,0 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr2
192.168.6.1:3260,0 iqn.2004-08.com.jetstor:824iX--000d23400:dev0.ctr2
192.168.195.22:3260,1 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr2
192.168.8.1:3260,1 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr2
```

2. Users can login and logout by # iscsiadm -m node with the ip and target name.

Operational mode -node is used to login/logout, the usage is

iscsiadm -m node -T target_iqn -p target_ip -l

iscsiadm -m node -T target_iqn -p target_ip -u

```
# iscsiadm -m node -T iqn.2004-08.com.jetstor:824iX--000d2340:dev0.ctr1 -p
10.10.10.100 -l
(login 10.10.10.100)
# iscsiadm -m node -T iqn.2004-08.com.jetstor:824iX--000d2340:dev0.ctr2 -p
192.168.195.22 -l
(login 192.68.195.22)
# iscsiadm -m node -T iqn.2004-08.com.jetstor:824iX--000d2340:dev0.ctr1 -p
10.10.10.100 -u
(logout 10.10.10.100)
# iscsiadm -m node -T iqn.2004-08.com.jetstor:824iX--000d2340:dev0.ctr2 -p
192.168.195.22 -u
(logout 192.168.195.22)
```

3. Query the list of nodes, the usage is

iscsiadm -m node.

```
# iscsiadm -m node
192.168.1.1:3260,0 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr1
192.168.2.1:3260,0 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr1
10.10.10.100:3260,1 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr1
192.168.4.1:3260,1 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr1
192.168.5.1:3260,0 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr2
192.168.6.1:3260,0 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr2
192.168.195.22:3260,1 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr2
192.168.8.1:3260,1 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr2
```

4. If users want to clear the node list, the usage is

iscsiadm -m node -o delete

5. This command will list the connected iSCSI session, it can be expressed as

iscsiadm -m session

```
# iscsiadm -m session
tcp: [3] 10.10.10.100:3260,1 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr1
tcp: [4] 192.168.195.22:3260,1 iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr2
```

6. In session mode, the iSCSI session can be logout, the usage is

iscsiadm -m session -r session_id -u

```
# iscsiadm -m session -r 3 -u
Logging out of session [sid: 3, target: iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr1,
portal: 10.10.10.100]
Logout of [sid: 3 target: iqn.2004-08.com.jetstor:824iX-000d2340:dev0.ctr1, portal:
10.10.10.100,3260]: successful
```

7. To log out all sessions, the usage is

iscsiadm -m session -u

How to enable and DM-Multipath and create multipath device

The procedures of setup a multipath DM-Multipath are as the following.

1. To enable mpathconf first, and then start the multipathd service

```
# mpathconf -h
usage: /sbin/mpathconf <command>
Commands:
Enable: --enable
Disable: --disable
Set user_friendly_names (Default n): --user_friendly_names <y|n>
Set find_multipaths (Default n): --find_multipaths <y|n>
Load the dm-multipath modules on enable (Default y): --with_module <y|n>
start/stop/reload multipathd (Default n): --with_multipathd <y|n>
chkconfig on/off multipathd (Default y): --with_chkconfig <y|n>

# mpathconf --enable
(It will create multipath.conf file as the configuration of multipath)
# service multipathd start
(To enable multipath)
```

2. Flush the existing device-maps and then create the dev-maps for the multipath device

```
# multipath -F
(Clear existing device-maps)

# multipath
(Create devicemaps)

create: mpathb (3203300137890ad00) undef jetstor,824iX
[size=500g feature='0' hwhandler='0' wp=undef
|-+- policy='round-robin 0' prio=1 status=undef
| '- 12:0:0:0 sdb 8:16 undef ready running
'-+- policy='round-robin 0' prio=1 status=undef
'- 13:0:0:0 sdc 8:32 undef ready running
```

TIP:

The device A as follow means failover. And another one means round-robin.

```
A. |+- policy='round-robin 0' prio=1 status=undef
| '- 12:0:0:0 sdb 8:16 undef ready running
' +- policy='round-robin 0' prio=1 status=undef
' - 13:0:0:0 sdc 8:32 undef ready running
B. |+- policy='round-robin 0' prio=1 status=active
| '- 12:0:0:0 sdb 8:16 active ready running
- 13:0:0:0 sdc 8:32 active ready running
```

How to implement ALUA (Optional)

You can refer the below to understand how to configure ALUA by multipath.conf. After implement AULA, the I/O will only go through the optimized path which is the pool controller owner side.

1. Edit the /etc/multipath.conf
2. Add the following pattern(red part) in multipath.conf

```
# vi /etc/multipath.conf
multipath {
    wwid 32033001378901d00
    alias test
    path_grouping_policy "group_by_prio"
    prio "alua"
    prio_args "exclusive_pref_bit"
}
```

How to exclude local disks (Optional)

There are two ways that the local disks can be excluded when generating multipath devices.

3. Determine which WWN of local disks will be ignored. In this example, using the command “multipath” can find out the WWN of local disk /dev/sda

```
# multipath -F
(Clear all multipath device maps)
# multipath
(Create multipath)
create: mpatha(1ATA ST31000528AS 9V)undef ATA,ST31000528A
[size=932G feature='0' hwhandler='0' wp=undef
'-+- policy='round-robin 0' prio=1 status=undef
| '- 2:0:0:0 sda8:0 undef ready running
create: mpathb (3203300137890ad00) undef jetstor,824iX
[size=500g feature='0' hwhandler='0' wp=undef
| -+- policy='round-robin 0' prio=1 status=undef
| | '- 12:0:0:0 sdb 8:16 undef ready running
'-+- policy='round-robin 0' prio=1 status=undef
| '- 13:0:0:0 sdc 8:32 undef ready running
```

4. The WWN of local disk /dev/sda is in the parenthesis followed by the word “mpatha”.Edit /etc/multipath.conf, and insert the WWN of local disk into the blacklist.

```
# vi /etc/multipath.conf
blacklist {
    wwid 1ATA ST31000528AS 9V
}
# service multipthd restart
```

5. User can also change the find_multipths to block the local disk

```
# multipath -find_multipaths y  
  
or  
  
# vi /etc/multipath.conf  
defaults{  
  find_multipaths yes  
}
```

TIP:
If you change the value of multipath.conf, you must restart multipath to take effect.

How to change the alias of iSCSI device (Optional)

The alias name will help iSCSI device to be identified easily. Find the UUID of iSCSI device in Red(mpathb) below:

```
# multipath -ll
mpathb (32033001378901d00) dm-3 jetstor,824iX
[size=500g feature='0' hwhandler='0' wp=rw
|-+- policy='round-robin 0' prio=1 status=active
| '- 12:0:0:0 sdb 8:16 active ready running
'--+- policy='round-robin 0' prio=1 status=enabled
'   '- 13:0:0:0 sdc 8:32 active ready running
```

1. Edit the /etc/multipath.conf again, and change the alias as “qsan”

```
# vi /etc/multipath.conf
multipaths {
    multipath {
        wwid 32033001378901d00
        alias qsan
        path_grouping_policy multibus
#        path_checker direction
        (This line may cause multipath be invalid in different device)
        path_selector "round-robin 0"
        failback manual
        rr_weight priorities
        no_path_retry 5
    }
}
```

2. Confirm that the persistent name to iSCSI device has been modified.

```
# multipath -ll
qsan (32033001378901d00) dm-3 jetstor,824iX
[size=500g feature='1 queue_if_no_path' hwhandler='0' wp=ro
|+- policy='round-robin 0' prio=1 status=active
'- 12:0:0:0 sdb 8:16 active ready running
'- 13:0:0:0 sdc 8:32 active ready running
# ls -l /dev/mapper
total 0
crw-rw---- 1 root root 10, 58 jul 28 18:34 control
lrwxrwxrwx 1 root root 7 jul 28 18:34 qsan -> ../dm-3
lrwxrwxrwx 1 root root 7 jul 28 18:34 VolGroup00-lv_home -> ../dm-2
lrwxrwxrwx 1 root root 7 jul 28 18:34 VolGroup00-lv_root -> ../dm-0
```

TIP:

Usually it uses the command multipath to manage the multipath devices.

Here is the parameter manual.

Multipath Without parameters, create the devmaps for the multipath devices.

-h	Print this usage text.
-l	Show multipath topology. (sysfs and DM info)
-ll	Show multipath topology. (maximum info)
-f	Flush a multipath device map.
-F	Flush all multipath device maps.
-c	Check if advice should be a path in a multipath device.
-q	Allow queue_if_no_path when multipathd is not running.
-d	Dry run, do not create or update devmaps
-r	Force devmap reload.
-p	Policy failover multibus group_by_serial group_by_prio.
-b fil	fil Bindings file location.
-p pol	pol Force all maps to specified path grouping policy:
	failover 1 path per priority group
	multibus all paths in 1 priority group
	group_by_serial 1 priority group per serial
	group_by_prio 1 priority group per priority level

-v lvl	group_by_node_name 1 priority group per target node Verbosity level: 0 no output 1 print created devmap names only 2 default verbosity 3 print debug information
Dev	Action limited to: Multipath named 'dev' (ex: mpath0) or Multipath whose wwidis 'dev' (ex:60051.. Multipath including the path named 'dev' (ex: /dev/sda) Multipath including the path with maj:min 'dev' (ex:8:0)

PRACTICE

Here is an example of how to create a multipath device and change the MPIO policy between failover and round-robin.

```
# multipath -F
(Clear existing device-maps)
# multipath
(Create devicemaps)
creat: jetstor (32033001378901d00) undef jetstor,824iX
[size=500g feature='0' hwhandler='0' wp=undef
|-+- policy='round-robin 0' prio=1 status=undef
'- 12:0:0:0 sdb 8:16 undef ready running
'- 13:0:0:0 sdc 8:32 undef ready running

# fdisk -l
Disk /dev/sda: 1000.2 GB, 1000204886016 bytes
255 heads, 63 sectors/track, 121601 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x000da7c4

Device Boot Start End Blocks Id System
/dev/sda1 * 1 64 512000 83 Linux
Partition 1 does not end on cylinder boundary.
/dev/sda2 64 121602 976248832 8e Linux LVM

Disk /dev/sdb: 107.4 GB, 107374182400 bytes
255 heads, 63 sectors/track, 13054 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0xa3872e75

Device Boot Start End Blocks Id System
/dev/sdb1 1 13054 104854528 7 HPFS/NTFS

Disk /dev/sdc: 107.4 GB, 107374182400 bytes
255 heads, 63 sectors/track, 13054 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
```

```
Disk identifier: 0xa3872e75

Device Boot Start End Blocks Id System
/dev/sdc1 1 13054 104854528 7 HPFS/NTFS

Disk /dev/mapper/jetstor: 107.4 GB, 107374182400 bytes
255 heads, 63 sectors/track, 13054 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0xa3872e75

# multipath -l
(List the multipath topology, default MPIO policy is multibus)
jetstor (32033001378901d00) dm-3 jetstor,824iX
[size=500g feature='1 queue_if_no_path' hwhandler='0' wp=rw
|-+- policy='round-robin 0' prio=0 status=active
'- 12:0:0:0 sdb 8:16 active ready running
'- 13:0:0:0 sdc 8:32 active ready running
```

You can change policy (ex:failover, multibus) by editing multipath.conf. We would also suggest to set the rr_min_io to 1 from 1000(default) which will improve the overall performance.

```
# vi /etc/multipath.conf
multipath {
    wwid                32033001378901d00
    alias               jetstor
    path_grouping_policy multibus
    (You can change failover by this line)
    path_selector        "round-robin 0"
    failback             manual
    rr_min_io           1
    (You can change to 1 from default 1000)
    no_path_retry        5
    rr_weight            priorities
}
```

Now, the abstract device /dev/mapper/jetstor which groups /dev/sdb and /dev/sdc are ready to be used.

Mount the file system on iSCSI device at boot time (Optional)

1. Format the iSCSI device as EXT4 file system.

```
# mkfs.ext4 /dev/mapper/jetstor
```

2. In order to mount a file system that exists on an iSCSI device connected through the open-iSCSI software initiator, you need to add a line to the /etc/fstab file.

```
# vi /etc/fstab  
/dev/mapper/jetstor /mnt/DataCoreSAN ext4 defaults ,_netdev 0 0
```

3. The _netdev option will delay the time when mounting the file system on listed devices until the network has been started. Also ensures that the file system is unmounted before stopping the network at shutdown

Performance

Test 824iX performance with 10 x SAS disks. And the configure setting is as follow.

824iX=1M Count=20480

```
# dd if=/dev/zero of=/dev/mapper/jetstor bs=2M count=20480
```

(I/O configure setting)

20480+0 records in

20480+0 records out

42949672960 bytes (43 GB) copied, 45.942 s, 934 MB/s

Conclusion

Follow the procedures; it's easy to implement iSCSI and multipath I/O in Linux OS. Take advantage of these two convenient packages cooperate with JetStor X series controllers, enjoy a fault tolerance and performance enhancement technique.
